

The effectiveness of Flagyl in *Trichomonas vaginalis* vaginitis has been so constant that use of less effective agents would seem to invite unnecessary failures. ■ The simplicity, completeness and persistence of cures with Flagyl qualify it as the logical first therapeutic choice in trichomonal infections.

Ten-day treatment with Flagyl oral tablets has replaced a multitude of untidy douches, powders, creams and jellies.

Flagyl is the only medication available that is able to reach all the crypts, glands and cavities of the female urogenital system as well as reservoirs of reinfection in male trichomonas carriers.

Flagyl eradicates resistant, deep-seated invasions of *Trichomonas vaginalis* and consistently produces cure rates above 90 per cent and often as high as 100 per cent in large series of patients. When the diagnosis is positive, Flagyl is positive.

Indications: For the treatment of trichomoniasis in both male and female patients and the sexual partners of patients with a recurrence of the infection provided trichomonads have been demonstrated by wet smear or culture. ■ **Contraindications:** Evidence of or a history of blood dyscrasia, in patients with active organic disease of the central nervous system, and the first trimester of pregnancy. ■ **Warnings:** Use with discretion during the second and third trimesters of pregnancy and restrict to patients not cured by topical measures. Flagyl is secreted in the breast milk of nursing mothers; it is not known whether this can be injurious to the newborn. ■ **Precautions:** Mild leukopenia has been reported during Flagyl use; total and differential leukocyte counts are recommended before and after treatment with the drug, especially if a second course is necessary. Avoid alcoholic beverages during Flagyl therapy because abdominal cramps, vomiting and flushing may occur. Discontinue Flagyl promptly if abnormal neurologic signs occur. There is no accepted proof that Flagyl is effective against other organisms and it should not be used in the treatment of other conditions. Exacerbation of moniliasis may occur. ■ **Adverse Reactions:** Nausea, headache, anorexia, vomiting, diarrhea, epigastric distress, abdominal cramping, constipation, a metallic, sharp and unpleasant taste, furry or sore tongue, glossitis and stomatitis possibly associated with a sudden overgrowth of *Monilia*, exacerbation of vaginal moniliasis, an occasional reversible moderate leukopenia, dizziness, vertigo, drowsiness, incoordination and ataxia, numbness or paresthesia of an extremity, fleeting joint pains, confusion, irritability, depression, insomnia, mild erythematous eruptions, "weakness," urticaria, flushing, dryness of the mouth, vagina or vulva, vaginal burning, pruritus, dysuria, cystitis, a sense of pelvic pressure, dyspareunia, fever, polyuria, incontinence, decrease of libido, nasal congestion, proctitis, pyuria and darkened urine have occurred in patients receiving the drug. Patients receiving Flagyl may experience abdominal distress, nausea, vomiting or headache if alcoholic beverages are consumed. The taste of alcoholic beverages may also be modified. ■ **Dosage and Administration:** *In the Female.* One 250-mg. tablet orally three times daily for ten days. Courses may be repeated if required in especially stubborn cases; in such patients an interval of four to six weeks between courses and total and differential leukocyte counts before, during and after treatment are recommended. Vaginal inserts of 500 mg. are available for use, particularly in stubborn cases. *When the vaginal inserts are used,* one 500-mg. insert is placed high in the vaginal vault each day for ten days and the oral dosage is reduced to two 250-mg. tablets daily during the ten-day course of treatment. Do not use the vaginal inserts as the sole form of therapy. *In the Male.* Prescribe Flagyl only when trichomonads are demonstrated in the urogenital tract, one 250-mg. tablet two times daily for ten days. Flagyl should be taken by both partners over the same ten-day period when it is prescribed for the male in conjunction with the treatment of his female partner. ■ **Dosage Forms:** Oral tablets.....250 mg. Vaginal inserts.....500 mg.

Have you seen this yet?

Close your eyes and have someone read this to you.

"He's coming out of the water. The rod looks like it's going to break. He's beautiful. The biggest marlin I've ever seen."

"Susan has grown so. She's becoming a fine young lady."

"The skirts are high again this year, and the colors are crazier than ever, mixing bright pinks with oranges and yellows."

"Jimmy lost his first tooth."

"The light is green now. You can cross."

This is what it is to see through the eyes of others. This is the blindness of glaucoma.

An estimated million Americans over 40 years of age have glaucoma and don't even know it. And every year about 4,000 of them go blind from it. And it needn't be.

Many cases of glaucoma can be arrested by regular use of prescribed medication. But only if it's caught early. And to catch it early, all it takes is a simple test, competently performed.

The more you take care of your health now, the less you'll need us later.

We believe there's more to good health than just paying bills.

**We hope all your patients will see it.
So that those who need to most will see you in time.**

We help you by helping your patients.

**Forecast:
arthritis
flare-ups**

Tandearil® oxyphenbutazone

Indications: Osteoarthritis, rheumatoid arthritis, rheumatoid spondylitis, psoriatic arthritis, gout, painful shoulder (peritendinitis, capsulitis, bursitis and acute arthritis of that joint), acute superficial thrombophlebitis, severe forms of a variety of local inflammatory conditions. (In inflammatory conditions not involving prolonged or fatal disease, use only when severity of condition balances potential toxicity.)

The drug has no significant uricosuric action but is of value only in the treatment of acute gouty arthritis.

Contraindications: Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile or when other potent drugs are given concurrently.

Warning: This drug is an analog of phenylbutazone; sensitive patients may be cross-reactive. If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Instances of severe bleeding have occurred. Persistent or severe dyspepsia may indicate peptic ulcer; perform upper gastrointestinal x-ray diagnostic tests if drug is continued. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy. Use with caution in the first trimester of pregnancy, and in patients with thyroid disease.

Precautions: Before prescribing, carefully select patients, avoiding those responsive to routine measures as well as contraindicated patients. Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should not exceed recommended dosage, should be closely supervised and should be warned to discontinue the drug and report immediately if fever, sore throat, or mouth le-

sions (symptoms of blood dyscrasia), sudden weight gain (water retention), skin reactions, black or tarry stools or other evidence of intestinal hemorrhage occur. Make complete blood counts at weekly intervals during early therapy and at 2-week intervals thereafter. Discontinue the drug immediately and institute countermeasures if the white count changes significantly, granulocytes decrease, or immature forms appear. Use greater care in the elderly and in hypertensives.

Adverse Reactions: The more common are nausea and edema. Swelling of the ankles or face may be minimized by withholding dietary salt, reduction in dosage or use of diuretics. In elderly patients and in those with hypertension, the drug should be discontinued with the appearance of edema. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. The patient should be instructed to take doses immediately after meals or with milk to minimize gastric upset. Drug rash occasionally occurs. If it does, promptly discontinue the drug. Agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), or a generalized allergic reaction similar to a serum sickness syndrome may occur and require permanent withdrawal of medication. Agranulocytosis can occur suddenly in spite of regular, repeated normal white counts. Stomatitis, salivary gland enlargement, vomiting, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported. While not definitely attributable to the drug, a causal relationship cannot be excluded. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hyperglycemia, hepatitis, jaundice, hypersensitivity angitis, pericarditis and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infre-

quently. Moderate lowering of the red cell count due to hemodilution may occur.

Dosage in Osteoarthritis, Rheumatoid Arthritis, Rheumatoid Spondylitis, Psoriatic Arthritis, Painful Shoulder (peritendinitis, capsulitis, bursitis, acute arthritis of that joint): Initial: 3 to 6 tablets daily in divided doses. Usually unnecessary to exceed 4 tablets daily. A trial period of one week is considered adequate to determine the therapeutic effect of the drug. Maintenance: Effective level often achieved with 1 or 2 tablets daily, should not exceed 4 tablets daily.

Dosage in Acute Gouty Arthritis: 4 tablets immediately, then 1 tablet every 4 hours until articular inflammation subsides, usually within 4 days. Dosage should not continue beyond 1 week.

Dosage in Acute Superficial Thrombophlebitis: 6 tablets daily in divided doses for 2 or 3 days, then reduce to 3 tablets daily. Usual duration of therapy is 5 to 7 days.

Dosage in Severe Forms of a Variety of Local Inflammatory Conditions: 4 to 6 tablets daily in divided doses for 2 or 3 days, then reduce to 3 tablets daily. Usual duration of therapy is 2 to 7 days.

In selecting appropriate dosage in any specific case, consideration should be given to the patient's weight, general health, age and any other factors influencing drug response.

Availability: Tan, round, sugar-coated tablets of 100 mg. in bottles of 100 and 1000. (B)R-46-800-A

clearing with Tandearil® oxyphenbutazone

Barometer falling, humidity up, storms on the way — storms of pain for many rheumatoid or osteoarthritic patients, the ones who “feel it in their bones”.

If aspirin isn't enough for these weather-sensitive patients, consider Tandearil.

While it won't clear every arthritic flare-up, most patients do respond within 3 to 4 days. But remember, Tandearil can produce some adverse reactions. So please review the full prescribing information describing patient selection, warnings and contraindications before using. A brief summary is above.

Of course, Tandearil works on sunny days, too.

Geigy

Scaled for the patient with high-level anxiety

Librium® (chlordiazepoxide HCl) 25-mg capsules

Because anxiety varies widely from patient to patient, and even in the same individual, Librium (chlordiazepoxide HCl) is supplied in various dosage strengths to suit the level of anxiety. Thus, during periods of acute emotional stress, the patient may need 25 mg Librium *t.i.d.* for relief. In mild to moderate anxiety, smaller doses of 5 or 10 mg, given three or four times daily, usually suffice.

The resulting improvement in outlook is a characteristic benefit of Librium therapy, utilized as an adjunct to your counsel and reassurance. Another advantage: Librium may also be used concomitantly with certain specific medications of other classes of drugs, whenever anxiety is a significant component of the clinical profile.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Indicated when anxiety, tension and apprehension are significant components of the clinical profile.

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring com-

plete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.

Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are

reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. In a few instances syncope has been reported. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasionally, making periodic blood counts and liver function tests advisable during protracted therapy.

Usual Daily Dosage: Individualize for maximum beneficial effects. *Oral*—Adults: Mild and moderate anxiety and tension, 5 or 10 mg *t.i.d.* or *q.i.d.*; severe states, 20 or 25 mg *t.i.d.* or *q.i.d.* Geriatric patients: 5 mg *b.i.d.* to *q.i.d.* (See **Precautions**.)

Supplied: Librium® (chlordiazepoxide HCl) Capsules, 5 mg, 10 mg and 25 mg—bottles of 50. Libritabs® (chlordiazepoxide) Tablets, 5 mg, 10 mg and 25 mg—bottles of 100. With respect to clinical activity, capsules and tablets are indistinguishable.

GREAT AMERICANS WHO WERE DOCTORS...

Elizabeth Blackwell

(1821-1910)

Dr. Blackwell is credited with being the first woman in modern times to become a physician. She earned her degree at the Geneva (New York) Medical School and was deeply involved with the social issues of her day. She established what was to become the New York Infirmary and also trained nurses for the Union Army during the Civil War.

WE AT GHI have also been under the spell of the pioneering spirit. Years ago we were first to add in-hospital medical care to Surgical Only contracts. We were among the very first to cover home calls and office visits. Our psychiatric research study led the way for insurance benefits for ambulatory psychiatric care.

We would like you to associate yourself with GHI either as a Participating Family Doctor or as a Participating Physician. By joining the approximately 10,000 doctors who already participate, you will extend quality medical care, with free choice of physician, to large groups of people, many of whom are classified as having low and medium incomes.

Write to us today for more information about why and how you should participate in GHI. Do it now – while you're thinking about it!

Group Health Insurance, Inc. / 227 West 40th Street, New York, N.Y. 10018 / Phone: 564-8900

a clinical
situation for
Valium® (diazepam):

psychic tension... and irritable colon

Included in the therapeutic regimen, Valium (diazepam) relieves psychic tension and helps lessen G.I. complaints.

The pronounced calming action of Valium (diazepam) is generally evident within the first days of therapy...proper maintenance dosages seldom dull the senses or interfere with functioning...the *h.s.* dose, added to the *t.i.d.* schedule, helps relieve insomnia induced by psychic tension.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms have occurred following abrupt discontinuance. Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective

amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation, have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.
